

LOGGERHEAD TURTLE

The

turtle

is

an

Australian.

The loggerhead turtle is a sea creature that is endangered. They make their home tropical waters.

They have a thick jaw and they can grow up to 1.1 meters long, and 364 kilograms in weight. The adult's are light brown, brown and reddish brown, brown head with a light brown belly. The hatchlings have a dark

The loggerhead turtle lives in sea grass meadows and in rock reefs, in coral and in slops in the bottom of the ocean. In tropical and sub-tropical waters, also in damp wet places. The hatchlings have a dark

Guinea. The loggerhead turtle eats other little sea creatures like molluscs, crabs, sea urchins, shell fish and jelly fish. The get their food off of the coral

and he rocks. The loggerhead turtle is an endangered reptile. It is endangered by humans for many reasons as in for their eggs and their fat. We can protect the

loggerhead turtle from becoming extinct by respecting their space, use different fishing nets so that they can get out. The loggerhead turtle breeds around October, they only breed every 2-5 years. They lay around 6 eggs per nesting season and in each egg contains 100-150 hatchlings. They will hatch late December too early April. In storms they get carried or they have to find their own way to the sea/ocean. They have to look after themselves. In

The loggerhead turtle is an awesome reptile and I think it should be saved from dyeing out.
